

Typical Application Circuit (Adjustable Operation)

Absolute Maximum Ratings (Note 1)

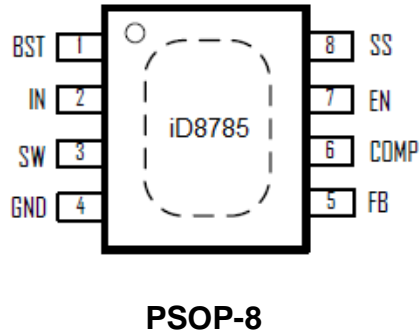

IN Voltage	-0.3V to 20V
SW, EN Voltage	-0.3V to $V_{IN}+0.3V$
BST Voltage	-0.3V to $V_{IN}+6V$
FB Voltage	-0.3V to 6V
Power Dissipation, P_D @ $T_A=25^\circ C$	
PSOP-8	1.33W
Thermal Resistance, θ_{ja}	
PSOP-8	75°C/W
Lead Temperature	260°C
Storage Temperature	-65°C to 150°C
ESD Susceptibility	
HBM (Human Body Mode)	2kV
MM (Machine Mode)	200V

Recommended Operating Conditions

Input Voltage V_{IN}	4.5V to 18V
EN Input Voltage	0V to V_{IN}
Junction Temperature	-40°C to 125°C
Ambient Operating Temperature	-40°C to 85°C

Pin Configurations

(Top View)

Pin Description

	Name	Description
1	BST	Bootstrap pin. Connect a 10nF capacitor from this pin to SW
2	IN	Supply Voltage. Bypass with a 22 μ F ceramic capacitor to GND
3	SW	Inductor Connection. Connect an inductor Between SW and the regulator output.
4	GND	Ground.
5	FB	Feedback Input. Connect an external resistor divider from the output to FB and GND to set VOUT
6	COMP	Regulator Compensation. Connect series RC network to GND.
7	EN	Enable pin for the IC. Drive this pin to high to enable the part, low to disable.
8	SS	Soft start pin. Connect a 0.1 μ F capacitor from this pin to GND

Electrical Characteristics ($V_{IN} = 12V$, unless otherwise specified. Typical values are at $T_A = 25^\circ C$)

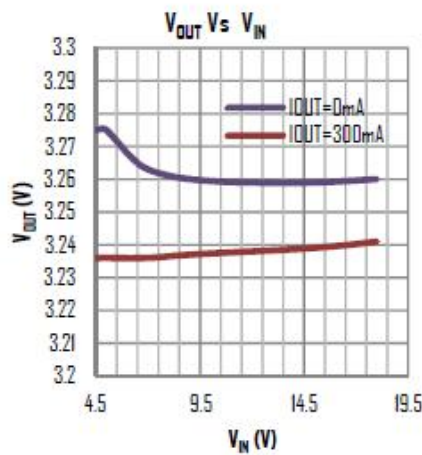

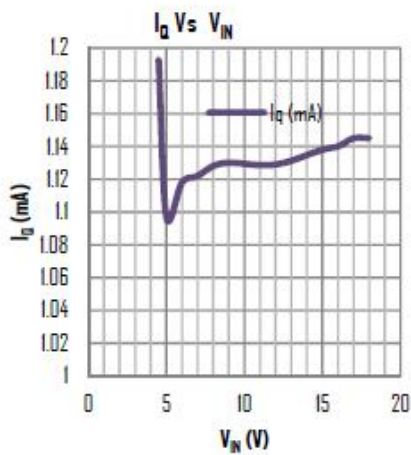

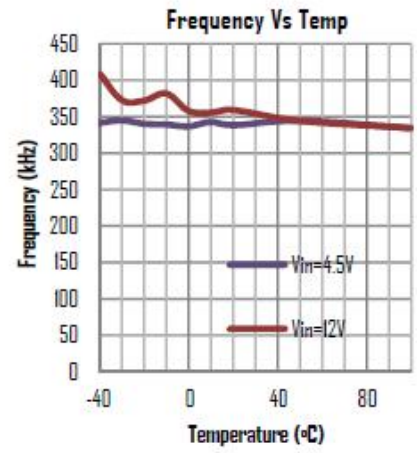

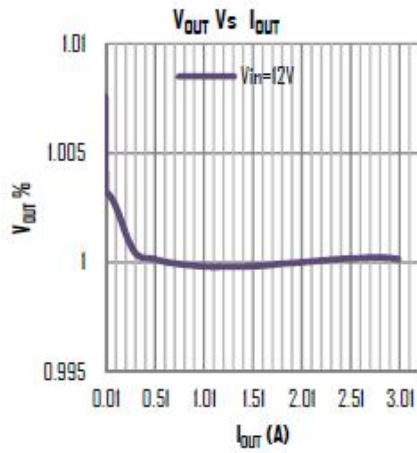

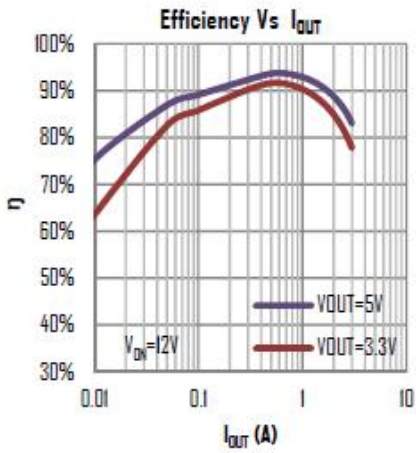

Parameters	Condition	Min	Typ	Max	Units
Input Voltage Range		4.5 <small>Note 2</small>		18	V
Input UVLO	Rising, Hysteresis=140mV		3.55		V
Input Supply Current	$V_{FB} = 1.0V$		1		mA
Input Shutdown Current			6		μA
FB Feedback Voltage		0.904	0.923	0.942	V
FB Input Current			0.01		μA
Error Amp Transconductance			800		μS
Current Sense Transresistance			0.2		Ω
Switching Frequency			340		kHz
High side Switch On Resistance	$I_{SW} = 200mA$		120		m Ω
Low side Switch On Resistance	$I_{SW} = 200mA$		100		m Ω
High side Switch Current Limit			3.5		A
SW Leakage Current	$V_{IN} = 12V, V_{SW} = 0$ or $12V, EN = GND$			10	μA
EN Input Current				1	μA
EN Input Low Voltage		1			V
EN Input High Voltage				3	V
Thermal Shutdown			150		$^\circ C$

Note 1: Stresses listed as the above "Absolute Maximum Ratings" may cause permanent damage to the device. These are for stress ratings. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

Note 2: When $V_{IN} = 4.5V$, $V_{OUT} = 3.3V$, maximum load current is about 0.5A.

Typical Operating Characteristics

(Typical values are at $T_A = 25^\circ\text{C}$ otherwise specified)

Applications Information

FUNCTION DESCRIPTION

Loop Operation

The iD8785 is a wide input range, high-efficiency, DC-to-DC step-down switching regulator, capable of delivering up to 3A of output current, integrated with a 120m Ω synchronous MOSFET, eliminating the need for external diode. It uses a PWM current-mode control scheme. An error amplifier integrates error between the FB signal and the internal reference voltage.

The output of the integrator is then compared to the sum of a current-sense signal and the slope compensation ramp. This operation generates a PWM signal that modulates the duty cycle of the power MOSFETs to achieve regulation for output voltage.

Current Limit

There is a cycle-by-cycle current limit on the high-side MOSFET of 3.5A (typ). When the current flowing out of SW exceeds this limit, the high-side MOSFET turns off and the synchronous rectifier turns on. Unlike the traditional method of current limiting by limiting the voltage at the compensation pin, which usually has large variation due to duty cycle variance, this type of peak current limiting scheme provides a relatively more accurate limit for output current, thereby lowering the requirements for system design.

Light Load Operation

Traditionally, a fixed constant frequency PWM DC-DC regulator always switches even when the output load is small. When energy is shuffling back and forth through the power MOSFETs, power is lost due to the finite RDSONs of the MOSFETs and parasitic capacitances. At light load, this loss is prominent and efficiency is therefore very low. iD8785 employs a proprietary control scheme that improves efficiency in this situation by enabling the device into a power save mode during light load, thereby extending the range of high efficiency operation.

Components Selection

V_{OUT} (V)	C_{OUT} (μ F)	L (μ H)
8	22x2	22
5	22x2	15
3.3	22x2	10
2.5	22x2	6.8
1.8	22x2	4.7
1.2	22x2	3.3
